The album is the feature that makes Lightroom truly unique, and is afforded a great deal of attention than any of the other features (including the image editor). It's not just a collection of images as on most photo management software, but rather a single, coherent album. It has its own Events tab, in which you can run Lightroom's Camera Raw settings on each image. You can also copy an image from one album as the one and only master image in another, which is great, because it means you can automatically apply settings from one image to another. You can also apply specific adjustments to one image across all of the images in a particular album. There are also only two options for a particular setting, so no more deciding whether you really want the strength or the warmth in your shadows. Sorry, but every setting is limited to a "Vivid" or "Portrait" setting, as though they are colored. The intelligent search panel will stop at the first 20 results for you, whatever they are, and the software will apply the settings to that number of images. You can narrow down images to just the ones with the Camera Raw settings you want the same way, and also the Lightroom settings, or you can use the "Select All" option on the right side of the search results list. Any adjustments and effects other than the Camera Raw settings and Lightroom will appear in a separate panel to the right of the search results. Usually, this guide can take a couple of hours to write, so I'm already thinking about how long it will take to build an album.
